Not illustrated. 1894 Excerpt: ... please advise me of the different methods now in use to prevent hot water from range boilers getting back into meters by expansion or by syphonage? I am quite familiar with putting a hole in the conducting tube, but that will not always overcome the difficulty. Suppose the boiler be suspended from the cellar joists and connected with a coil in a furnace, as shown in the illustration. The regulations here require that a check valve shall be placed between the meter and the boiler, which I consider a dangerous practice, and as yet have never done it, as there would be no chance for expansion. Am I right? The meters here are easily spoiled by hot water, as the pistons are made of hard rubber. Answer.--Some put a small notch or hole in the check valve to provide for the expansion, depending on the cool pipe and water to overcome the heating effect of the small quantity of water that passes through. It is probable that a safety valve, located so the overflow would be caught in some fixture, would answer every purpose. LOCAL CIRCULATION BETWEEN TWO BOILERS. From H. S.--I have a conundrum which I would like to submit to the readers of The Metal Worker--viz., Why does hot water flow from the cold water cocks at the wash basins, and continue so until about two pailfuls are drawn, after which cold water will come? The two boilers are connected with two ranges, as shown in the drawing. One is 52 gallons and the other 40 gallons. The supply is from a tank in upper story. The horizontal pipes are straight from where they turn down to the basins to the furthest boiler and about 12 inches above boilers. There is fire in both ranges all the time. Pipes are inch diameter. I think I have

found the cause of the trouble, and propose to remedy it by putting a check valve at E....
