

Quranic Text: Toward a Retrieval System

The feeling that Islamic literature deserves and requires an Islamic classification scheme has been met with widespread dissatisfaction among information scientists in the Muslim world. However, indexing the classical Quranic exegeses and Hadith collections still requires an initial operation list of both subject headings of both Quranic and Hadith texts. The book is based on an investigation of the terminology in the Quranic text for the purpose of designing a retrieval system. It makes use of conceptual verses and words as partial examples for the required task. These examples are used to test the factors affecting the design at both the documentary and computation levels. At the documentary level, the examples are used to examine the effects of Quranic terminology on the commentators and to see how it affects the performance of the retrieval system. It also examines the characteristics of the Quranic vocabulary, against the problems known to be encountered in constructing an efficient retrieval system. On the computation level, the examples are used to examine the possibility of the Quran in its stylistic form being processed by the computer. As a result, the study offers guidelines and recommendations with two examples for the natural and social sciences as a model for constructing a retrieval system for Quranic text.
